THE PROBLEM OVERVIEW AND THE PROPOSED SOLUTION.

THE PROBLEM OVERVIEW

- Projects go overbudget because of a lack of precise data, making investments less appealing and halting innovation.
- The Canadian government will be spending an estimated \$159 billion over the next 5 years on infrastructure, with "no single, timely source that provides a complete picture of total infrastructure spending", as per the Office of the Parliamentary Budget Officer (PBO).

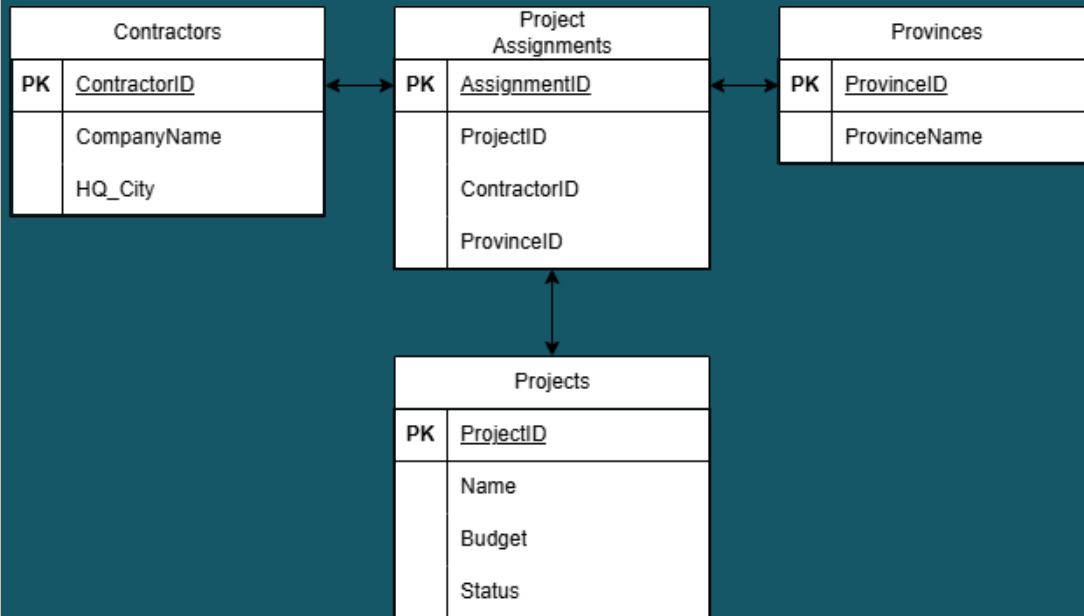

THE PROPOSED SOLUTION

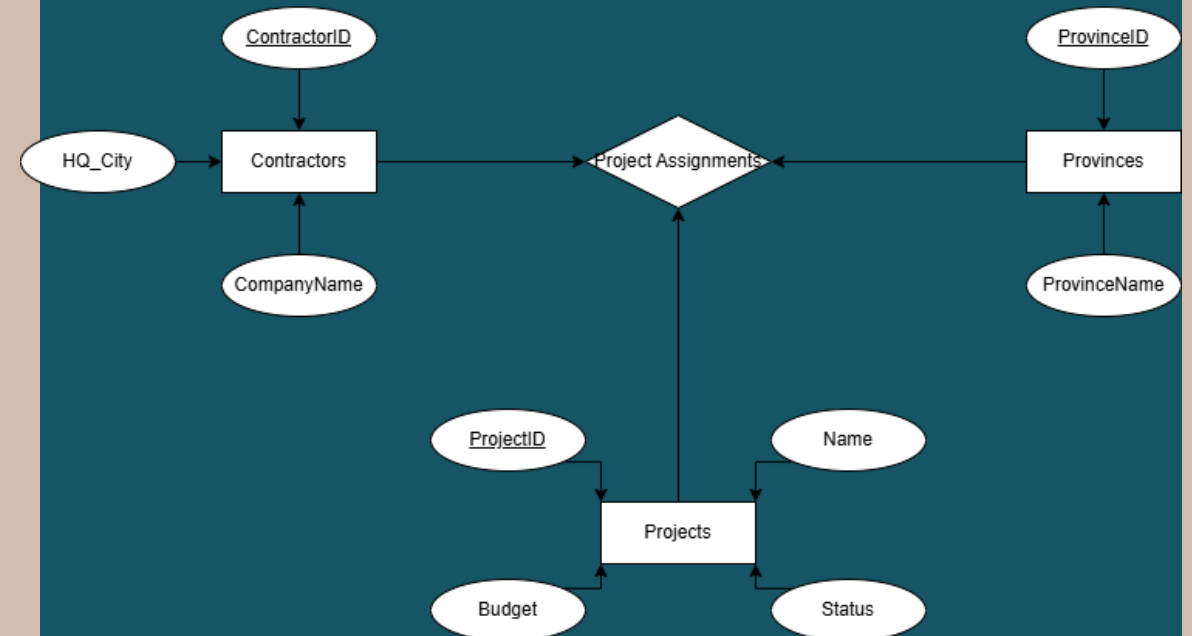

- Our solution is to create a relational National Infrastructure Project Database that organizes all project data into a clear schema with tables, including:
 - Projects, Provinces, Contractors, and a junction table for ProjectAssignments.
- This design allows the ICC to easily track project status, budgets, regional distribution, and Which company/contractor is responsible for each project.
